# PROBLEM STATEMENT

- Cities often have multiple routes between locations.
- 
- The challenge is to find the most cost-efficient (shortest or least expensive) route.
- 
- Traditional search methods may not guarantee optimality.
- 
- Goal: Use Uniform Cost Search (UCS) to identify the least-cost path between two points in a city map.
- 
- Applications:
- 
- GPS Navigation Systems (Google Maps, Uber)
- 
- Delivery Route Optimization
- 
- Traffic Management Systems
-

# THEORETICAL BACKGROUND

Artificial Intelligence in Pathfinding:

AI algorithms help computers make intelligent decisions in route and pathfinding tasks.

Search Algorithms:

Techniques to explore possible paths from source to destination.

Examples: Breadth-First Search (BFS), Depth-First Search (DFS), UCS, A\*.

Uniform Cost Search (UCS):

A weighted version of BFS.

Expands the least-cost node first.

Always finds the optimal path if path costs are non-negative.

UCS Characteristics:

Uses a priority queue (min-heap) based on cumulative path cost.

Continues exploring paths until the goal is reached.

Guarantees an optimal solution

Mathematical Concept:

Total Cost ( $C$ ) =  $\sum$  edge weights from start to current node.

Complexity:

Time:  $O(b^{(C^*/\epsilon)})$

Space:  $O(b^{(C^*/\epsilon)})$

Where  $b$  = branching factor,  $C^{**}$  = cost of optimal solution.

# OUTPUT AND RESULTS

The screenshot shows the Programiz Python Online Compiler interface. At the top, there is a logo for Programiz and the text "Python Online Compiler". To the right, there is a button labeled "Programiz PRO". Below this, there are two tabs: "main.py" and "Output". The "Output" tab is currently selected. To the right of the tabs, there are three icons: a sun icon, a share icon, and a play button icon. Below the tabs, the output of the program is displayed in a monospace font:

```
Shortest Path: ['A', 'C', 'B', 'E']  
Total Cost: 3
```

# OUTPUT AND RESULTS

- **Explanation:**
- 
- **UCS explores all possible routes and chooses the one with the least total cost.**
- 
- **In this case:**
- 
- **$A \rightarrow B \rightarrow C \rightarrow D = \text{Cost } 2 + 1 + 2 = 5$**
- 
- **Other paths had higher costs, so they were not selected.**
- 
- 
- 
- **Result Visualization (optional):**
- 
- **Display graph/map using matplotlib or draw a simple route diagram.**
-
